Atlence FileTime Manager, a personal information manager with a set of handy features, is offered in a clean and simple way, as a small free standalone application. The application takes.NET Framework 3.5, and is written in C#, and supports Windows XP, Vista, and Windows 7. It works on the first run, and you can set options right there in the setup wizard. The main window makes it easy to locate files of interest through the side tree list

of all folders, so you can find out more about them, and change their timestamps with a click of the right mouse button. Selecting one automatically enlists all detected files in a larger panel with info like name, date created, modified, and last accessed. You can either change the timestamp of a single file directly, select more, or simply switch to the mass processing tab in order to select a folder to apply a new timestamp to all files and folders inside. The application allows you to set time periods in

which to detect file changes, and automatically changes the date of one or more files, or simply notify you on changes. There are three target time fields you get control over, namely creation, modified, and last access date. At the press of a button, a corresponding field is automatically filled with current time and date settings, and you're not forced to modify all fields. The application comes with a built-in scheduler which you can configure to automatically do so every once in a while, and there's even a

scheduling tab for the user to freely set a date and time when to trigger the process. It also has an alarm feature that can be set to notify you on file changes in a selected timeframe, restore original date, or run a program of your choice. In addition to all the mentioned features, the application has a couple of other features. The first one is a file explorer, which can be used to browse all folders and subfolders to access the files of interest. You can open the folder's content from the application's

context menu. The application also has a color scheme chooser for the display window, a system information viewer, and a system default date and time finder, which helps you change the computer's date and time settings, or get default ones for different countries.
